1. Linear Independence

Let $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_t$ be vectors in a vector space V . Then $\text{Span}(\vec{v}_1, \vec{v}_2, \dots, \vec{v}_t)$ is a subspace of V .

Definition 1. • The set of vectors $\vec{v}_1, \dots, \vec{v}_p$ in V is said to be **(linearly) independent** if the homogeneous vector equation

$$x_1\vec{v}_1 + x_2\vec{v}_2 + \dots + x_p\vec{v}_p = \vec{0}$$

only has the trivial solution $x_1 = x_2 = \dots = x_p = 0$.

• If there exists a nontrivial solution (a_1, a_2, \dots, a_p) , then $\vec{v}_1, \dots, \vec{v}_p$ is said to be **(linearly) dependent**. In this case,

$$a_1\vec{v}_1 + a_2\vec{v}_2 + \dots + a_p\vec{v}_p = \vec{0}$$

is a **nontrivial relation** among the vectors $\vec{v}_1, \dots, \vec{v}_p$.

Remark 2. A (possibly infinite) subset W of a vector space V is said to be *linearly independent* if all finite subsets of W are linearly independent.

Remark 3. Unlike in the case of $V = \mathbb{F}^n$, in the general setting of vector spaces, equation (1) *cannot* be written as a matrix equation (directly).

We say a vector \vec{v}_i (for $i \geq 2$) is **redundant** if it is a linear combination of the preceding vectors $\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_{i-1}\}$, i.e.,

$$\vec{v}_i = a_1\vec{v}_1 + a_2\vec{v}_2 + \dots + a_{i-1}\vec{v}_{i-1}$$

Proposition 4. Suppose \vec{v}_i is redundant in $\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p\}$. Then

$$\text{Span}\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p\} = \text{Span}\{\vec{v}_1, \vec{v}_2, \dots, \widehat{\vec{v}_i}, \dots, \vec{v}_p\}.$$

Here $\widehat{\vec{v}_i}$ is removed.

Proof. Clearly, $\text{Span}\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p\} \supseteq \text{Span}\{\vec{v}_1, \vec{v}_2, \dots, \widehat{\vec{v}_i}, \dots, \vec{v}_p\}$. We show \subseteq next. Suppose $\vec{u} \in \text{Span}\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p\}$. Then $\vec{u} = c_1\vec{v}_1 + c_2\vec{v}_2 + \dots + c_p\vec{v}_p$. Replace \vec{v}_i by the above redundant equation, \vec{u} is a linear combination without \vec{v}_i . Hence, $\vec{u} \in \text{Span}\{\vec{v}_1, \vec{v}_2, \dots, \widehat{\vec{v}_i}, \dots, \vec{v}_p\}$. \square

Proposition 5. • Suppose $\vec{v}_1 \neq \vec{0}$. The set $\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p\}$ is independent if and only if none of them is redundant.

- If the set $\{\vec{v}_1, \dots, \vec{v}_p\}$ of vectors contains the zero vector $\vec{0}$, then it is linearly dependent.
- If a subset of the set $\{\vec{v}_1, \dots, \vec{v}_p\}$ is linearly dependent, then $\{\vec{v}_1, \dots, \vec{v}_p\}$ is dependent.

Proof. The first claim is equivalent to: the set $\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p\}$ is dependent if and only if one of them is redundant.

“ \Rightarrow ” Suppose $\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p\}$ is dependent. Then

$$a_1\vec{v}_1 + a_2\vec{v}_2 + \dots + a_p\vec{v}_p = \vec{0}$$

has non-trivial solution. Let i be the largest number such that $a_i \neq 0$. ($i \neq 1$ since $\vec{v}_1 \neq \vec{0}$). Then

$$-a_i\vec{v}_i = a_1\vec{v}_1 + a_2\vec{v}_2 + \dots + a_{i-1}\vec{v}_{i-1}$$

So,

$$\vec{v}_i = -a_i^{-1}a_1\vec{v}_1 - a_i^{-1}a_2\vec{v}_2 - \dots - a_i^{-1}a_{i-1}\vec{v}_{i-1}$$

That is, \vec{v}_i is redundant.

“ \Leftarrow ” Suppose \vec{v}_i is redundant. Then

$$\vec{v}_i = a_1\vec{v}_1 + a_2\vec{v}_2 + \dots + a_{i-1}\vec{v}_{i-1}$$

So,

$$a_1\vec{v}_1 + a_2\vec{v}_2 + \dots + a_{i-1}\vec{v}_{i-1} - \vec{v}_i = \vec{0}$$

So, $\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p\}$ is dependent.

The proof of the rest two are easy. \square

Proposition 6. A set $\{\vec{v}\}$ is linearly dependent if and only if $\vec{v} = \vec{0}$.

A set $\{\vec{u}, \vec{v}\}$ is linearly dependent if and only if one of the two vectors is a scalar multiple of the other vector.

In \mathbb{F}^n , the vector equation $x_1\vec{v}_1 + x_2\vec{v}_2 + \dots + x_p\vec{v}_p = \vec{0}$ is equivalent to using the matrix equation $A\vec{x} = \vec{0}$ or the augmented matrix $[A \mid \vec{0}]$. So $A = [\vec{v}_1 \ \dots \ \vec{v}_p]$ is an $n \times p$ matrix.

Proposition 7. The set $\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p\} \subset \mathbb{F}^n$ is independent if and only if the homogeneous equation only has zero solution;
if and only if there is no free variable;
if and only if all columns contain pivots;
if and only if $\text{rank}(A) = p$; (i.e., A has full rank.)
if and only if $\ker(A) = \{\vec{0}\}$.

Proposition 8. If $p > n$, then a set $\{\vec{v}_1, \dots, \vec{v}_p\}$ of vectors in \mathbb{F}^n is linearly dependent.

Proof. From the above proposition, if the set is independent, $\text{rank}(A) = p \leq n$. □

Warning: The preceding property does **not** say that $p \leq n$ implies that $\{\vec{v}_1, \dots, \vec{v}_p\}$ is linearly independent.

2. Basis of a vector space

Definition 9. Let V be vector space over \mathbb{F} . A subset $B = \{\vec{b}_1, \dots, \vec{b}_n\}$ of V is called a **basis** for V if

- (i) B is linearly independent, and
- (ii) $\text{Span}\{\vec{b}_1, \dots, \vec{b}_n\} = V$.

A subset B of a vector space V has a “greater chance” of being

- linearly independent, if it has fewer vectors;
- a spanning set of V , if it has more vectors.

A basis B for a vector space V is a set that has balanced these two competing requirements. We can think of a basis B as a spanning set that is as small as possible, and as a linearly independent set that is as large as possible.

More precisely, we have

Theorem 10. If $\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_n\}$ is independent in V , and $V = \text{Span}\{\vec{w}_1, \vec{w}_2, \dots, \vec{w}_m\}$, then $m \geq n$.

Proof. We add \vec{v}_1 to the **spanning** set and get a **dependent** set

$$\{\vec{v}_1, \vec{w}_1, \vec{w}_2, \dots, \vec{w}_m\}$$

Since $\vec{v}_1 \neq 0$, we can remove one of \vec{w}_i from the set.

We then add \vec{v}_2 to the new spanning set and get a dependent set

$$\{\vec{v}_1, \vec{v}_2, \vec{w}_1, \dots, \widehat{\vec{w}_i}, \dots, \vec{w}_m\}.$$

Claim: One of the w 's is redundant.

Proof of claim: If all w 's are not redundant, $a_1\vec{v}_1 + a_2\vec{v}_2 + a_3\vec{w}_1 + \dots + a_{m+1}\vec{w}_m = \vec{0}$ has a non-trivial solutions $(a_1, a_2, 0, 0, \dots, 0)$. That is $a_1\vec{v}_1 + a_2\vec{v}_2 = \vec{0}$ which is a contradiction.

So, we can remove one redundant w_j 's and get a new spanning set

$$\{\vec{v}_1, \vec{v}_2, \vec{w}_1, \dots, \widehat{\vec{w}_i}, \dots, \widehat{\vec{w}_j}, \dots, \vec{w}_m\}.$$

Keep adding the rest of v 's and remove the redundant w 's. We get a spanning set with $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_n$ and the n w 's removed. So, we must have $m \geq n$. □

Example 11. The column vectors of the identity matrix I_n , $\vec{e}_1, \vec{e}_2, \dots, \vec{e}_n$ form a standard basis for \mathbb{F}^n .

Example 12. Find a basis for the vector space M_2 of all 2×2 matrices. The standard basis for M_2 is $\left\{ \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} \right\}$

Example 13. Find a basis for the vector space P_2 of all polynomials of degree ≤ 2 . The standard basis for P_2 is $\{1, t, t^2\}$.

Theorem 14 (Spanning Set Theorem). *Let V be a vector space and let $S = \{\vec{v}_1, \dots, \vec{v}_p\}$ be a subset of V with $\text{Span}\{\vec{v}_1, \dots, \vec{v}_p\} = H$.*

- *If one of the vectors in S , say \vec{v}_k , is a linear combination of the remaining vectors in S , then the set $S - \{\vec{v}_k\}$ still spans H ,*

$$H = \text{Span}\{\vec{v}_1, \dots, \vec{v}_p\} = \text{Span}\{\vec{v}_1, \dots, \vec{v}_{k-1}, \vec{v}_{k+1}, \dots, \vec{v}_p\}$$

- *If $H \neq \{\vec{0}\}$ then some subset of S is a basis for H .*

Remark 15 (Algorithm for Finding a Basis). The preceding theorem provides a recipe for finding a basis for a subspace H of a vector space V . Namely,

- Pick a generating set $S = \{\vec{v}_1, \dots, \vec{v}_p\}$ of H .
- Keep removing vectors from S that are linear combinations of other vectors in S .
- Once there are no more vectors left in S that are linear combinations of other vectors in S , S is a basis for H .

From the algorithm, we obtained that

Proposition 16. (1) *Every spanning set of a finite-dimensional vector space can be reduced to a basis.*

(2) *Any finite-dimensional vector space has a basis.*

(3) *Any independent set in a finite-dimensional vector space can be extended to a basis.*

Proof. For part (3), we need the trick in the proof of Theorem 10

□

3. The Dimension of a Subspace

For a finite-dimensional vector space V , it has many different bases. However, they contain some common properties.

Theorem 17. *If $\mathcal{B} = \{\vec{b}_1, \dots, \vec{b}_p\}$ and $\mathcal{D} = \{\vec{d}_1, \dots, \vec{d}_m\}$ are two bases for V , then $p = m$.*

Proof. A basis is independent and span the space V . So, $p \leq m$ and $p \geq m$. Then $p = m$.

□

Definition 18 (The Dimension of a Vector Space). The **dimension** of a vector space V is defined as

$$\dim V := \text{The cardinality of any basis for } V,$$

i.e., the number of elements in a basis.

By convention, the dimension of the vector space $V = \vec{0}$ is 0.

Example 19. The dimension of \mathbb{F}^n is n .

Lemma 20. Suppose $\mathcal{B} = \{\vec{b}_1, \dots, \vec{b}_p\}$ is a basis for V . (That is $\dim V = p$.)

- (1) Any set of more than p vectors is linearly dependent.
- (2) Any set of less than p vectors can not span V .

Proof. From Theorem 10 in the last subsection. □

Theorem 21 (The Basis Theorem). Let V be a vector space with $\dim(V) = p \geq 1$.

- Any linearly independent set of exactly p elements in V is automatically a basis for V .
- Any set of p elements in V that span V , is automatically a basis for V .

Proof. (1) Suppose $\{\vec{u}_1, \vec{u}_2, \dots, \vec{u}_p\}$ is independent in V . If there is a vector $\vec{v} \in V$, such that $\vec{v} \notin \text{Span}\{\vec{u}_1, \vec{u}_2, \dots, \vec{u}_p\}$, then $\{\vec{u}_1, \vec{u}_2, \dots, \vec{u}_p, \vec{v}\}$ is independent in V . This is a contradiction to the above Lemma.

(2) Suppose $V = \text{Span}\{\vec{w}_1, \vec{w}_2, \dots, \vec{w}_p\}$. If $\{\vec{w}_1, \vec{w}_2, \dots, \vec{w}_p\}$ is dependent, then we can delete a redundant element from it and the rest still span V . This is a contradiction by the above Lemma. □

Theorem 22. Let U be a subspace of a finite-dimensional space V . There is a subspace W such that $V = U \oplus W$.

Proof. Suppose $\{\vec{u}_1, \dots, \vec{u}_p\}$ is a basis of U . We can extend it to a basis of V by adding $\{\vec{w}_1, \dots, \vec{w}_m\}$. Define $W := \text{Span}\{\vec{w}_1, \dots, \vec{w}_m\}$. Claim: $V = U + W$ and $U \cap W = \{\vec{0}\}$. (Verify this.) □

Theorem 23. Let U and V be subspaces of a finite-dimensional space. Then

$$\dim(U + V) = \dim U + \dim V - \dim(U \cap V)$$

Proof. Idea of the proof: Start from a basis $\vec{w}_1, \dots, \vec{w}_p$ of $U \cap V$ and extend it to be a basis $\vec{w}_1, \dots, \vec{w}_p, \vec{u}_1, \dots, \vec{u}_m$ of U and a basis $\vec{w}_1, \dots, \vec{w}_p, \vec{v}_1, \dots, \vec{v}_n$ of V . Then $\dim U \cap V = p$, $\dim U = p + m$, and $\dim V = p + n$.

Claim: $\vec{w}_1, \dots, \vec{w}_p, \vec{u}_1, \dots, \vec{u}_m, \vec{v}_1, \dots, \vec{v}_n$ form a basis of $U + V$. (Verify this from definition.) □

In particular, $\dim(U \oplus V) = \dim U + \dim V$. On the other side, we have the following theorem.

Corollary 24. Let U and W be subspaces of an n -dimensional space V . Suppose $\dim U + \dim W = n$ and $U \cap W = \{\vec{0}\}$, then $V = U \oplus W$.

Theorem 25. Suppose V is a finite dimensional and U_1, \dots, U_p are subspaces of V such that $V = U_1 + \dots + U_p$ and $\dim V = \dim U_1 + \dots + \dim U_p$. Then $V = U_1 \oplus \dots \oplus U_p$.

Proof. Suppose $\vec{0} = \vec{u}_1 + \cdots + \vec{u}_p$. □

4. Basis of Null space and range

Let $T : V \rightarrow W$ be a linear transformation. The **rank** of T is defined as the dimension of the image of T . The **nullity** of T is defined as the dimension of the kernel of T .

Theorem 26. *Let $T : V \rightarrow W$ be a linear transformation. Then*

$$\dim V = \dim(\ker T) + \dim(\operatorname{im} T)$$

Proof. Suppose $\vec{w}_1, \dots, \vec{w}_p$ is a basis for $\ker T$. We can extend it to a basis $\{\vec{w}_1, \dots, \vec{w}_p, \vec{v}_1, \dots, \vec{v}_m\}$ of V . Then, $\dim V = p + m$ and $\dim \ker T = p$.

Claim: $\{T(\vec{v}_1), \dots, T(\vec{v}_m)\}$ is a basis for $\operatorname{im} T$. (Verify this from definition: span and independent). □

Let A be an $m \times n$ matrix. The linear transformation defined by A is $T_A : \mathbb{F}^n \rightarrow \mathbb{F}^m$. We know that $\dim(\ker T) + \dim(\operatorname{im} T) = n$. Now, we can also find basis for each space.

Theorem 27 (Basis for $\operatorname{im}(A)$). *A basis for the image $\operatorname{im}(A)$ is given by the pivot columns of A . In particular, $\dim(\operatorname{im} A) = \operatorname{rank} A$.*

Proof. $\operatorname{im}(A) = \operatorname{Span}\{\vec{a}_1, \dots, \vec{a}_n\}$. Suppose the pivot columns are $\vec{a}_{c_1}, \vec{a}_{c_2}, \dots, \vec{a}_{c_r}$. They are independent and all other columns are redundant columns, because they are corresponding free variables. Hence, $\operatorname{im}(A) = \operatorname{Span}\{\vec{a}_{c_1}, \vec{a}_{c_2}, \dots, \vec{a}_{c_r}\}$. So, $\{\vec{a}_{c_1}, \vec{a}_{c_2}, \dots, \vec{a}_{c_r}\}$ is a basis for $\operatorname{im}(A)$. □

Theorem 28 (Basis for $\ker(A)$). *Let A be an $m \times n$ matrix. Solve the matrix equation $A\vec{x} = \vec{0}$. Write \vec{x} as a linear combination of vectors $\vec{v}_1, \dots, \vec{v}_p$ with the weights corresponding to the free variables. Then $\{\vec{v}_1, \dots, \vec{v}_p\}$ is a basis for $\ker(A)$.*

Proof. First, we know that $\ker(A) = \operatorname{Span}\{\vec{v}_1, \dots, \vec{v}_p\}$. Since p is the number of free variables, so $\dim(\ker T) = n - \dim(\operatorname{im} A) = p$. So, $\{\vec{v}_1, \dots, \vec{v}_p\}$ is a basis for $\ker(A)$. □

Theorem 29 (The Dimensions of $\ker(A)$ and $\operatorname{im}(A)$). *Let A be an $m \times n$ matrix. Then,*

$$\dim(\ker(A)) + \dim(\operatorname{im}(A)) = n.$$

Proof. Consider the matrix equation $A\vec{x} = \vec{0}$. The dimension of $\ker(A)$ is the number of free variables in the equation $A\vec{x} = \vec{0}$. The dimension of $\operatorname{im}(A)$ is the number of pivot columns in A , which is also the rank of A . So the sum $\dim(\ker(A)) + \dim(\operatorname{im}(A))$ is the total number of variables. □

Theorem 30. Let A be an $n \times n$ square matrix.

A is **invertible**, if and only if the columns vectors span \mathbb{F}^n ;

if and only if the columns vectors of A are independent;

if and only if the columns vectors of A form a basis for \mathbb{F}^n .

5. Examples

Example 31. Find bases for the kernel and image of the transformation defined by $A = \begin{bmatrix} 0 & 0 & 2 & -8 & -1 \\ 1 & 6 & 2 & -5 & -2 \\ 2 & 12 & 2 & -2 & -3 \\ 1 & 6 & 0 & 3 & -2 \end{bmatrix}$.

We already know $\mathbf{rref}(A) = \begin{bmatrix} 1 & 6 & 0 & 3 & 0 \\ 0 & 0 & 1 & -4 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$

A vector $\vec{b} \in \mathbb{R}^n$ belongs to the column space of A if and only if there exist numbers x_1, \dots, x_p such that

$$x_1 \vec{a}_1 + \dots + x_p \vec{a}_p = \vec{b}.$$

This in turn happens if and only if the matrix equation $A\vec{x} = \vec{b}$ has at least one solution \vec{x} .

This last point shows that $\text{im}(A) = \mathbb{F}^p$ if and only if the matrix equation $A\vec{x} = \vec{b}$ has a solution \vec{x} for every choice of $\vec{b} \in \mathbb{F}^n$.

Proof. **Proof of the uniqueness of reduced echelon form:**

□

Example 32. Can you find a 3×3 matrix A such that $\dim(\ker A) = \dim(\text{im}(A))$?

Example 33. Can you find a 4×4 matrix A such that $\dim(\ker A) = \dim(\text{im}(A))$?

Example 34. If an 4×4 matrix $A = BC$ such that B is a 4×3 matrix and C is a 3×4 matrix. Is A invertible?

Example 35. A subspace V of \mathbb{F}^n is called a **hyperplane** if V is defined by

$$c_1x_1 + c_2x_2 + \dots + c_nx_n = 0$$

where at least one c_i is not zero. What is the dimension of V ?

A vector $\vec{b} \in \mathbb{R}^n$ belongs to the column space of A if and only if there exist numbers x_1, \dots, x_p such that

$$x_1 \vec{a}_1 + \dots + x_p \vec{a}_p = \vec{b}.$$

This in turn happens if and only if the matrix equation $A\vec{x} = \vec{b}$ has at least one solution \vec{x} .

This last point shows that $\text{im}(A) = \mathbb{F}^p$ if and only if the matrix equation $A\vec{x} = \vec{b}$ has a solution \vec{x} for every choice of $\vec{b} \in \mathbb{F}^n$.

Example 36. Let T be the transformation defined by $A = \begin{bmatrix} -3 & 6 & -1 & 1 \\ 1 & -2 & 2 & 3 \\ 2 & -4 & 5 & 8 \end{bmatrix}$.

Suppose we already know $\mathbf{rref}(A) = \begin{bmatrix} 1 & -2 & 0 & -1 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$

Q1. Find **bases** for the **kernel** and **image** of T .

Q2. What are the dimensions of for the **kernel** and **image** of A ?

Q3. Is $\vec{u} = \begin{bmatrix} 3 \\ 1 \\ -2 \\ 1 \end{bmatrix}$ in the kernel $\ker(A)$?

Q4. Is $\vec{v} = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$ in the column of A ? Is $\vec{w} = \begin{bmatrix} -1 \\ 2 \\ 5 \end{bmatrix}$ in the column of A ?

Example 37. Let $S(n)$ be the subset of $M_n(\mathbb{R})$, defined by

$$S(n) = \{A \in M_n(\mathbb{R}) \mid A = A^T\}$$

Show that $S(n)$ is a subspace. What is a basis for $S(n)$? What is the dimension of $S(n)$?

Example 38. Let $O(n)$ be the subset of $M_n(\mathbb{R})$, defined by

$$O(n) = \{A \in M_n(\mathbb{R}) \mid A = -A^T\}$$

Show that $O(n)$ is a subspace. What is a basis for $O(n)$? What is the dimension of $O(n)$?
